

High Level System Architecture and workflow (Plain English)

I have shared two more documents — document 1 is which is what I need you to read and understand — is the Project Charter. It explains what we are building, why we are building it, how it will work for your workers and your leadership team, and what the delivery plan looks like.

The second document is the System Architecture. That section is written for me and any future developer who works on this platform. It is technical by nature and you do not need to read or understand it. It is included in this document so that everything is in one place and so that you have full visibility of the technical decisions being made on your behalf.

Below is a plain-English summary of exactly how the platform will work — from the moment a worker logs in to the moment leadership pulls a payroll report.

Plain-English Platform Workflow — For the CEO

What This Platform Is

This is the operating system of GlobalSolutions. It is a private, password-protected website that only GlobalSolutions workers, admins, and leadership can access. It replaces WhatsApp coordination, manual RDP allocation, spreadsheet payroll, and disconnected quality tracking with one controlled, real-time system.

Every worker has an account. Every manager has an account. Every RDP machine is registered in the system. Everything that happens — every shift, every session, every hour worked, every quality rating — is recorded automatically.

How It Works — Step by Step

Step 1 — Workers Submit Their Schedules

Instead of sending availability tables through the group chat, every worker logs into the platform and selects the days and hours they are available to work that week. The system stores their submission and notifies the relevant admin immediately. No messages, no tables, no manual reading.

Step 2 — Admin Reviews and Approves Shifts

The operations admin logs in and sees a queue of all submitted availabilities. They review each one, approve it, and at the same moment assign a specific RDP machine to that worker for that shift. The worker instantly receives a notification inside the platform confirming their shift and telling them exactly which machine they will use.

Step 3 — Workers Log In at Shift Time and Claim Their Machine

When a worker's shift begins, they log into the platform and see their assigned machine clearly marked as ready for them. They click one button to claim it. The system checks that it is their shift, that the machine is available, and that no one else has it — all in under a second. The worker is then connected to their remote desktop directly through their browser. No software to install. No password to type. No confusion about which machine to use.

Step 4 — The System Tracks Everything Automatically

From the moment the worker claims the machine to the moment they release it, the system records every minute. It tracks how long they worked, which machine they used, and whether the session ended cleanly. If a worker closes their browser without releasing the machine, the system detects this automatically and releases the machine after a short window, returning it to the available pool. Nothing requires manual intervention.

Step 5 — Leadership Sees Everything in Real Time

At any moment, leadership can log in and see a live dashboard showing every machine in the organisation — which are active, which are free, which are offline, and who is currently working on which machine. There is no need to ask anyone. The information is live, accurate, and always available.

Step 6 — Quality Is Tracked and Scored

Every worker in the system has a quality score. This score is built from two things: the results of training assessments they complete inside the platform, and ratings applied by their manager after reviewing their work. The score is calculated automatically and updates over time. Workers can see their own score. Leadership can see everyone's score and track improvement or decline over time.

Step 7 — Workers Compete on a Leaderboard

The platform shows a live leaderboard visible to all workers. It ranks them by total hours worked, quality score, sessions completed, and reliability. Workers can see where they stand against their teammates and against the wider organisation. This is designed to motivate performance and create accountability without requiring constant management pressure.

Step 8 — Payroll Is Generated From Verified Session Data

At the end of every payroll period, the system already has a complete record of every hour every worker has worked, on which machine, at which rate. The admin reviews the period, resolves any exceptions, and exports a clean payroll report. This replaces the

manual spreadsheet process entirely. The numbers come from verified session records, not from manual entries, which means fewer disputes and fewer errors.

Step 9 — Leadership Has Full Organisational Control

Leadership can log in at any time and see the full state of the organisation. Active workers, idle machines, hours accumulated, quality scores, payroll summaries, exception flags, and audit records are all visible in one place. If something needs to be corrected — a session that ran too long, a machine that needs to be locked, a worker record that needs updating — it can be done directly from the dashboard with a reason recorded automatically.

What the System Replaces

What You Do Now	What the Platform Does Instead
Workers send availability via WhatsApp	Workers submit shifts directly in the platform
Admin allocates RDPs manually	System assigns RDP on shift approval
No visibility of which machines are on or in use	Live RDP board visible to all roles
Payroll calculated from spreadsheet	Payroll generated from verified session records
Quality tracked informally	Quality scored automatically from assessments and ratings
No worker performance visibility	Live leaderboard with hours, quality, and reliability
Leadership asks for updates manually	Leadership dashboard shows everything in real time
No audit trail	Every action recorded with who did it and when

What This Means for the Business

The platform removes the ceiling on how many workers GlobalSolutions can manage. With manual coordination, every new worker added creates more messages, more confusion, and more risk of errors. With this system, adding a new worker takes two minutes — create their account, set their rate, assign their country — and the system handles everything else.

It also means GlobalSolutions can prove what happened. If there is ever a payroll dispute, a quality concern, or a security question, the answer is in the system. Every session, every action, every approval is logged permanently. This is what makes scale possible without losing control.

That is everything he needs to read and understand. Ready to generate the full HTML document when you say go.

Regards,

Kibiru Kelvin.

Lead Software Developer And system architect.
